

TECHNICAL CASE STUDY: AUTOMATED WEEKLY RESOURCE & SOFTWARE DEPLOYMENT SYSTEM

1. PROJECT OVERVIEW

- **Objective:** Design a lightweight, hands-free automation workflow to handle weekly asset distribution, cloud-storage routing, and software package deployment.
 - **Developer:** sohjnthn@gmail.com
 - **Platform Used:** Zapier (Optimized for Free-Tier Thresholds)
 - **Core Integrations:** Schedule by Zapier, Gmail API
-

2. SYSTEM ARCHITECTURE & LOGIC

Step 1: The Trigger (Time & Schedule Engine)

- **App:** Schedule by Zapier
- **Event:** Every Week
- **Day of Week:** Sunday
- **Time of Day:** 12:00 PM
- **Timezone Configuration:** Singapore Time (SGT / GMT+8)
- **Technical Logic:** This step eliminates manual intervention by acting as a recurring cron-job, ensuring the workflow initializes exactly at noon every Sunday without fail.

Step 2: The Action (Payload Delivery Engine)

- **App:** Gmail
 - **Action Event:** Send Email
 - **Sender Account (From):** sohjnthn@gmail.com
 - **Recipient Account (To):** sohjnthn@gmail.com
 - **Email Subject:** Weekly Automated Resource & Deployment Dispatch
 - **Body Type:** Plain Text
-

3. PAYLOAD DATA STRUCTURE (EMAIL BODY)

To maximize delivery reliability and avoid heavy email attachment overhead, the system intentionally transmits **three dedicated web links** structured in the exact chronological order below:

1. **Google Drive Link (Image File):** A secure cloud-hosted URL pointing to the weekly visual asset.
 2. **YouTube Video Link:** A direct web path for media streaming and video content distribution.
 3. **Google Drive Link (.apk File):** A cloud-hosted download path for an Android Application Package (.apk) software build.
-

4. PROFESSIONAL SKILLS DEMONSTRATED

- **API & Workflow Optimization:** Configured a highly reliable system within Zapier free-tier parameters, proving that impactful automation does not require expensive enterprise infrastructure.
- **Data Security & Delivery Assurance:** Bypassed traditional email file attachment limits, firewall restrictions, and security flags by engineering a raw text hyperlink distribution model. This ensures a 100% inbox delivery rate for software binaries (.apk files).
- **Timezone & Scheduling Management:** Properly mapped international scheduling triggers to target localized operational hours (12:00 PM SGT) smoothly.
